

```
const int ledsPerStrip = 20; // Maximale Anzahl Pixel pro Strang
```

Als Strang ist hier ein Kanal gemeint, also eine Paarung z.Bsp. Orange/Orange-Weiss. Insgesamt kann ein Teensy 8 Kanale/Stränge haben.

```
int PixelCount = 100; // Effektive Anzahl Pixel, da ledsperStrip = 20 werden für 100 LEDs 5 Kanäle benötigt
```

Interessant wird es nun diese Anordnung in Vixen darzustellen.

Durch const int ledsPerStrip = 20 verteilen sich diese auf 5 Kanäle

Bei int PixelCount haben wir 100 Pixel, also 100 LED's mit je drei Farben, also 300 Outputs

Man muss demnach beim Mappen der Pixel in Vixen rechts erst die passenden Outputs markieren, und danach auf der linken Seite die LED(Kette) wählen.

Die erste Kette mit 10 LED's am Kanal 1 hat 30 Outputs.

Aufgrund von const int ledsPerStrip = 20 rechnet Teensy nun mit potentiell 20 möglichen LED's und 60 Outputs Kanälen.

Daher beginnt die 2. Kette mit 5 LEDs bei Output 61.
